

EARTH

Earth is the third planet from the sun and is the only known planet to sustain life. It is a terrestrial planet with a diverse range of environments, including land masses, oceans, and atmosphere. Earth has a diverse climate, with temperatures ranging from below freezing at the poles to over 100°F (37.8°C) in some tropical regions.

The Earth's diameter is approximately 12,742 kilometers (7,918 miles), and it has a circumference of about 40,075 kilometers (24,901 miles) at the equator. It is about 93 million miles (149.6 million kilometers) away from the sun.

Earth is home to an incredible variety of life, including millions of different species of plants, animals, and microorganisms. Humans are the most recent addition to the planet's diverse array of life forms.

Overall, Earth is a unique and remarkable planet, with a rich natural history and a complex system that sustains life.
