

Seed to Apple

Once Upon a Time... a Seed!

It all starts with a tiny seed! Imagine a small, brown seed hidden inside a juicy apple. If you plant that seed in the ground, something magical can happen!

Hello, Little Sprout!

With sunshine and water, the seed starts to grow! It sends out a tiny root down into the soil and a little sprout up towards the sky. This little sprout will become an apple tree!

Growing Up Big and Strong!

The sprout grows bigger and bigger, becoming a strong tree with branches and leaves. It needs lots of sunshine, water, and good soil to grow tall and healthy. Birds might even build nests in its branches!

Pretty Blossoms!

In springtime, the apple tree is covered in beautiful pink and white blossoms! These flowers smell so sweet and attract busy bees. The bees help the flowers make baby apples.

Little Green Apples!

After the blossoms fall off, tiny green apples start to grow! They are small and hard at first, but they grow bigger and bigger throughout the summer.

Red, Yellow, or Green?

As summer turns to Autumn, the apples ripen and change colour. They might become red, yellow, or green, depending on the kind of apple tree. Now they are juicy and delicious and ready to be picked!

Yummy Apple Treat!

Finally, the ripe apples are picked from the tree and enjoyed by people all over the world! You can eat them whole, make applesauce, or bake them into a yummy apple pie. And remember, each apple has seeds inside, so the cycle can start all over again!
